Docket No.: 4444-062

PATENT

ABSTRACT:

Please replace the current Abstract and enter the following new Abstract.

ABSTRACT

A client accesses services provided by a service provider by transmitting and/or receiving information in a point-to-point session with a session concentrator via a telecommunication network. An access control protocol controls access to the services provided by the service provider. A client that does not conform is authorized to access a network for non-conforming clients. A point-to-point session is established between the non-conforming client and the session concentrator. The session concentrator transfers the information transmitted by the non-conforming client to a network for clients that conform to the access control protocol.
